[Imaging Review of Skeletal Tumors of the Pelvis Malignant ...](#)

Tue, 29 Nov 2011 23:59:00 GMT

Malignant lesions of the pelvis are not uncommon and need to be differentiated from benign lesions and tumor mimics. Appearances are sometimes nonspecific leading to consideration of a broad differential diagnosis. Clinical history, anatomic location, and imaging characterization can help narrow the differential diagnosis. The focus of this paper is to demonstrate the imaging features and the ...

[Imaging of Spinal Metastatic Disease - Hindawi](#)

Fri, 19 Aug 2011 23:59:00 GMT

Metastases to the spine can involve the bone, epidural space, leptomeninges, and spinal cord. The spine is the third most common site for metastatic disease, following the lung and the liver. Approximately 60–70% of patients with systemic cancer will have spinal metastasis. Materials/Methods. This is a review of the imaging techniques and typical imaging appearances of spinal metastatic disease.

Nowadays, the medical imaging modality of elastography can also be used to determine the stiffness of tissues. Manual palpation suffers from several important limitations: it is limited to tissues accessible to the physician's hand, it is distorted by any intervening tissue, and it is qualitative but not quantitative. Elastography is able to overcome many these challenges and improve on the ...
